

The Wrong Site

Designed by group 5

For PC

02/09/2021

Game Story

You work as a guard at a new secret robot production facility. Because you worked for a long time, your job has gotten very dull lately, so you decided to spend time on your phone, so the time goes by a bit faster. One day, however, you land upon a site that promises to 'spice things up a bit'. As the bored security guard that you are, you press 'accept'. The promise turned out to be true, as all the alarms go off immediately! A quick look at the security cameras and you can tell your night is about to get a lot less boring. The site seemed to have deployed a virus affecting the robots in the facility. Your goal is to get to the control room and enter the kill-code to disable the robots.

Game Play

Players shoot their way through rooms of out-of-control robots. Occasionally, they will face an extra big bot blocking the way to the control room. As the player clears more rooms, the enemies get tougher. The player will have to get smarter, by laying traps, using diverse types of weapons, using powerups, hiding and using the environment to your advantage. Eventually, after many floors, they will reach the secure control room in the basement where they can enter the secret override code to disable the robots.

Elevator Pitch

An fps where the player fights their way, through enclosed rooms of various size, battling military war robots to survive.

Player Character

The Guard: This is the player. They work as a guard at a secret robot production facility. Out of boredom, they accidentally deployed a virus affecting all the robots in the facility.

It will not be possible to customize the face, hair, clothes, sex, or anything at all from the Guard. However, it is possible to buy armour from the store with scrap left from executed robots.

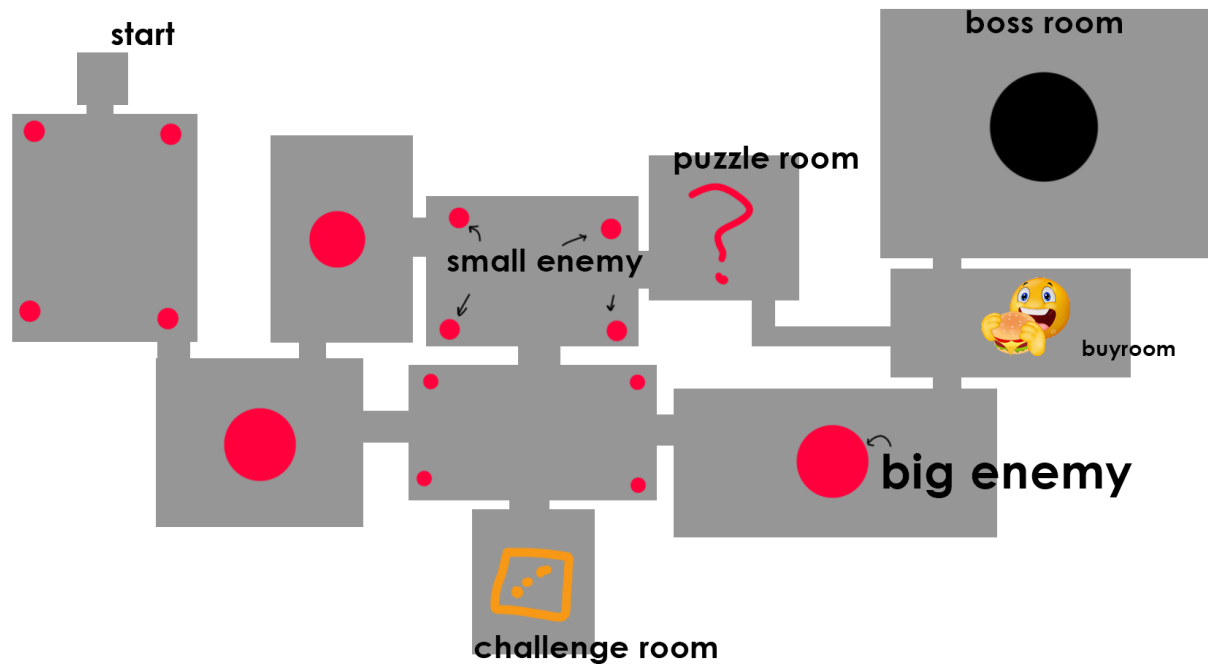

The Guard, what they look like, can be seen in the image above.

Player Controls (PC)

W	Move
A	Strafe left
S	Move backwards
D	Strafe right
Space	Jump
Left Click	Firing selected weapon
Control	Crouching
Shift	Walking
1-5	Weapon selection
Scroll Wheel	Weapon scroll

Game World

The game takes place in a secret facility. The facility has all the functions it needs for self-sustainability. It contains some cafeterias, a gym, and offices, which are connected through corridors of various sizes. The facility produces robots, so there are production rooms, incinerators, and labs as well. These rooms contain mechanical components like conveyor belts and mechanical arms. The lab contains parts of robots and experimental features.

Game Experience

The game can be divided by floor, which consist of four base components: regular enemy rooms, puzzles, challenges, a mini-boss, and a cafeteria to buy items.

Enemy rooms

Enemy rooms have a set number of enemies, which are randomly picked from prefabs. The position of the enemies is always the same, though the environment can vary a bit. There are rooms where four enemies are put into each corner of a (square) room, and there are rooms where there is one big enemy in the middle. It will be random which type (four enemies or one) the player encounters. To give the player more freedom of how to take the enemies down, there will be platforms and obstacles to ensure creative gameplay.

Puzzle rooms

These rooms are composed of platforms and puzzles, which give the player a break from shooting enemies. This means the rooms have an objective without enemies. Puzzles consist of code cracking / lockpicking, pressing buttons or pressure plates in a certain order or rhythm-based puzzles, like disappearing platforms. At the end of a puzzle room, the player gets a powerup, regardless of the time it took them to clear it.

Challenge rooms

Players have an opportunity to get a powerup in challenge rooms. These are completely optional. However, the player has only one chance to get it, so if they fail, they must proceed with the main rooms. These rooms can be time based or contain a certain mechanic that can only be used once, for example catching an invincible enemy (to prevent the player from just killing it) which runs away after x time. If the player fails a challenge, they will not get punished, they just miss the power up.

Boss room

At the end of each floor, the player encounters a boss battle, which is an enemy with more health, extra steps to take it down, phases or a combination of two or more. The boss is only one enemy but is difficult to kill. Boss rooms can have environmental features which assist the player in forming a strategy to kill the boss. Once the boss is defeated, the player can proceed to the cafeteria and then the next floor.

Cafeteria

Cafeterias are safe zones for the player, a checkpoint where they can heal, buy items, and then go to the next floor. The player can buy healing items, and weapons to kill enemies more easily.

Game Mechanics

The player is allowed to walk, move around, jump and crouch. Since **The Wrong Site** is a first-person shooter game, the player can also shoot down enemies with their gun. When doing so, the robots leave scrap on the ground to pick up.

With scrap left from the robots, the player can buy items in the cafeteria. These being armour, med-kits, emp's, better weapons, a variety of traps and blast- and stick grenades. There are some items called "power-ups". The player can't buy these but can only receive them as a reward when solving a puzzle before the timer runs out. The power-up will last until the game is over.

There are different types of power-ups: Extra max. health, Looting, Protection, Explosive Damage and Critical Damage.

Extra max. health: Increases the maximum health of the player with 20%. However, the player doesn't get extra health from this power-up. Only the maximum health the player can have, is increased.

Looting: This increases the amount of scrap a robot drops with 10%.

Protection: This makes the player receive a shield that blocks three bullets from robots. After that, the shield breaks.

Explosive Damage: Blast grenades deal twice as much damage. When throwing one, it'll kill every robot (except bosses) in an eight-meter radius. However, the player is only allowed to carry one blast grenade.

Critical Damage: Temporarily, all your bullets deal 25% more damage to robots.

Game aesthetics:

Theme

Robots, Survival, Mission

Setting

Secret robot production facility, futuristic, mechanical, consisting of vertical components.

Mood

Threatened, dark, mechanic (as in, lots of steel, robots, machines) red alarm lights. Robots with red

Eight kinds of fun

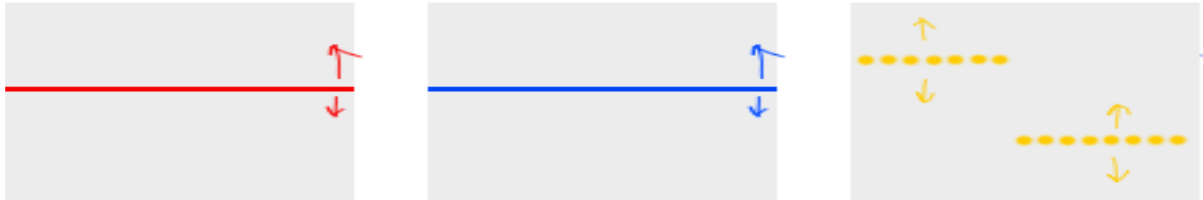

Challenge: The game is about survival, getting a fast time in the challenge rooms, and clearing puzzle rooms.

Enemies

Mini bosses

Encountered at the end of each floor. Mini boss must be defeated in order to go through to the next floor. Each mini boss has a single element of the final boss. Laser sweeping the arena at feet height (red), laser sweeping at head height (blue) or ceiling laser.

Mini bosses move around the room and shoot at you.

Final boss

Encountered in the control room (very last room) where the player will get access to the button after defeating the boss.

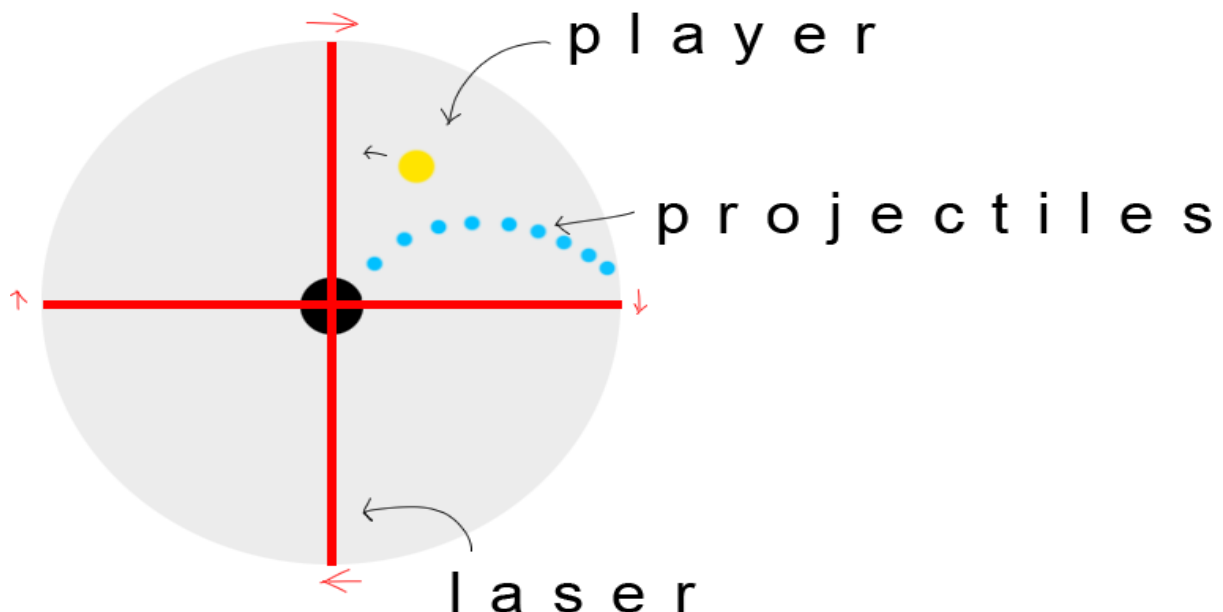

Room is circular.

The final boss is a stationary robot in the middle of the room and has several phases depending on how much life the boss has left (75%, 50% and 25%)

Each time the boss enters a new phase it becomes invulnerable for a certain amount of time. While the boss is invulnerable all attacks go faster.

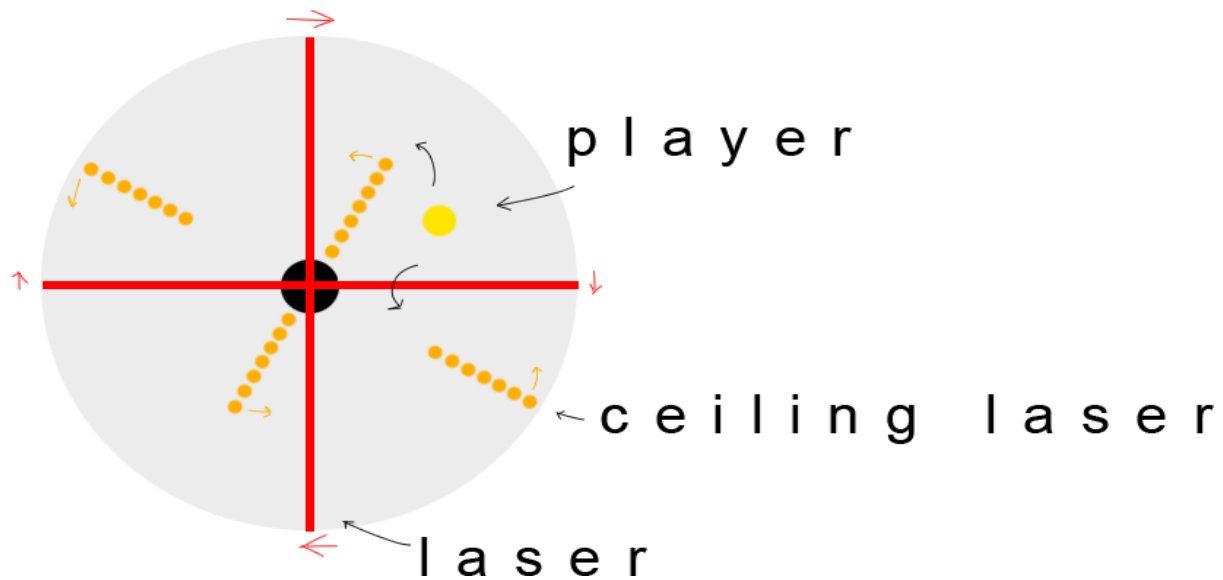

First phase 100% health:

The boss slowly tracks his weapon and shoots projectiles at you from its stationary position and has an active cross shaped laser reaching from itself to the wall of the arena. The cross shaped laser is constantly turning clockwise the player must dodge the projectiles being fired at him and make sure not being hit by the traps. The (red) is set to feet height so the player has the choice to run from or jump over the laser.

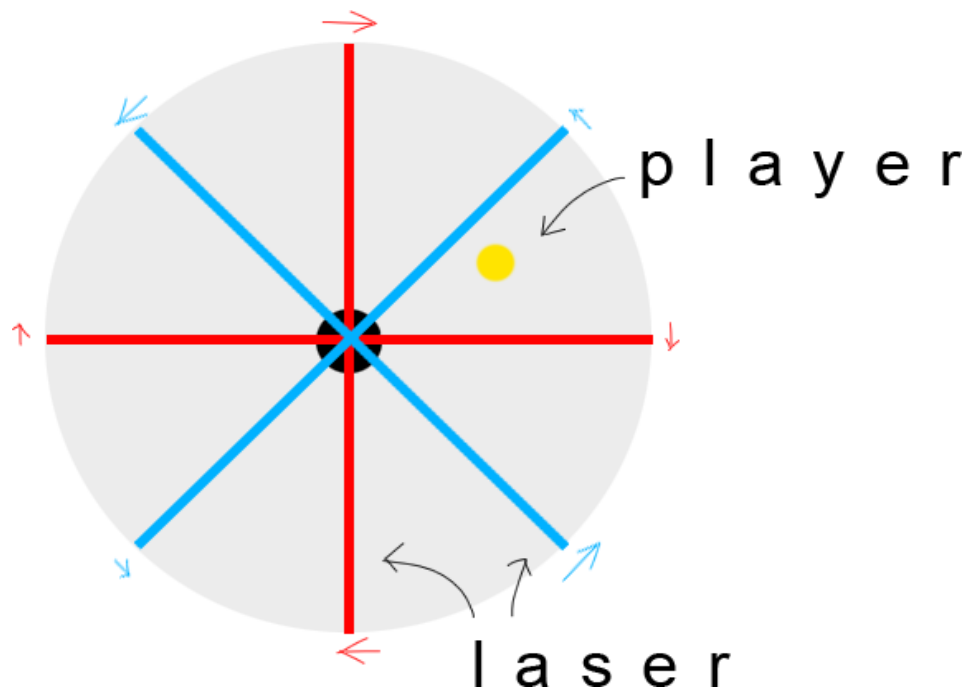

Second phase 75 health:

The boss stops shooting projectiles and adds a wall of lasers reaching from ceiling to floor covering half of the radius of the arena and is also moving around him. These lasers move slower than the red lasers. The ceiling lasers cannot be avoided by jumping over or ducking under them. Player has to walk/run in order to avoid .

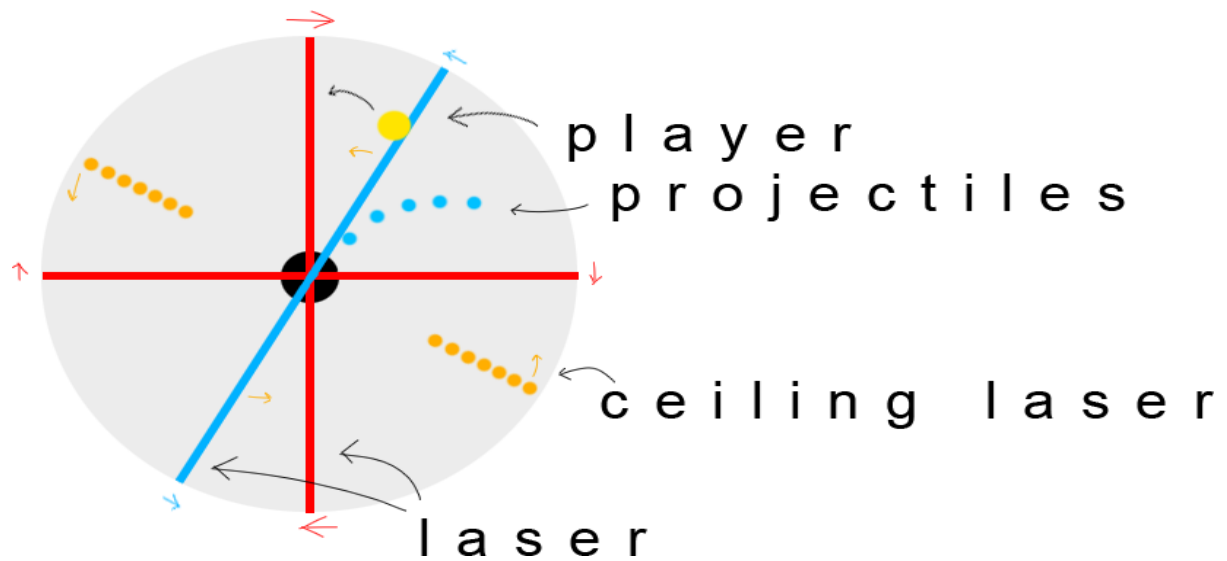

Third phase 50% health:

The boss stops using the ceiling lasers and starts doing a second cross-shaped laser attack reaching from itself to the wall turning counter-clockwise. Bot lasers turn at a faster pace during the whole phase. The blue laser is set at head height, so the player has the choice to run away or duck under the laser.

Fourth phase 25% health:

The fourth phase combines previous attacks. The boss starts shooting projectiles again and the blue cross shaped laser is now only a single laser. The ceiling lasers come back to replace the missing half of the blue laser.

After defeating the boss:

The stationary boss explodes and the player now has access to a button (where the boss used to be) to destroy the virus.

Cutscenes

Cutscenes are optional additions for this game but can be used to inform the player of where and who they are in the beginning of the game and what happens when the player enters the kill-code and disables the robots.

Opening

This cutscene is used to show the facility, the function of it and the layout of a floor. The player is shown they are a security guard who finds his job more than boring. This can be done using dialogue. The player could see the production process of the robots, what they are used for and how dangerous they are when they go rogue.

Ending

When the player enters the kill-code in the console on the bottom floor, the robots shut down. The player sees the facility is completely lifeless apart from themselves. Everything shuts down except doors and lights. Here the player truly realises the damage done to the facility and its workers, as there are dead bodies all over the place and robots torn into pieces to state the magnitude of the massacre and destruction that happened, partially by the player's hands.
